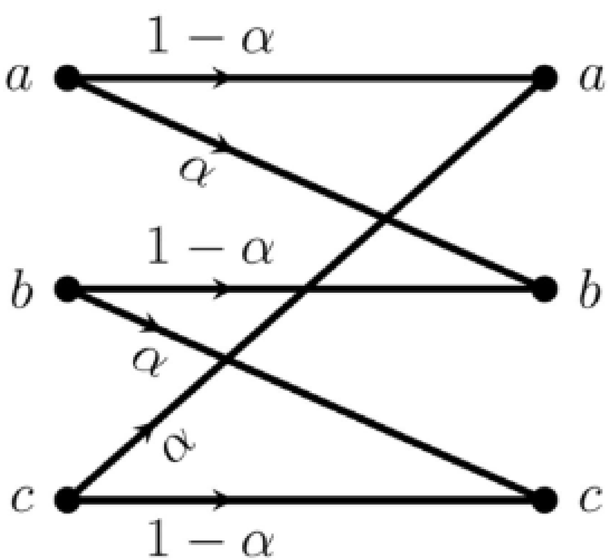
Question:- The transition diagram of a discrete memoryless channel with three input symbols and three output symbols is shown in the figure. The transition probabilities are as marked. The parameter α lies in the interval $[0.25, 1]$. The value of α for which the capacity of this channel is maximized, is

Solution:



Variable	Description	Value
X	Input variable	$X = \{0, 1, 2\}$
Y	Output variable	$Y = \{0, 1, 2\}$
C	Channel Capacity	C
I	Mutual Information	I
H	Entropy	H

$$C = \max_{p(X,Y)} I(X, Y) \tag{1}$$

$$I(X, Y) = \sum_{x,y} p(x, y) \log_2 \frac{p(x, y)}{p(x)\, p(y)} \tag{2}$$

$$= \sum_{x,y} p(x, y) \log_2 \frac{p(y|\, x)}{p(y)} \tag{3}$$

$$= -\sum_{x,y} p(x, y) \log_2 p(y) + \sum_{x,y} p(x, y) \log_2 p(y|\, x) \tag{4}$$

$$= -\sum_{y} p(y) \log_2 p(y) - \left(-\sum_{x,y} p(x, y) \log_2 p(y|\, x)\right) \tag{5}$$

$$= H(Y) - H(Y|\, X) \tag{6}$$

For $X = 0$

$$p_Y(0) = \sum_{y=0}^{2} p_{Y|X}(y|\, x)\, p_X(x) \tag{7}$$

$$= \frac{1}{3} \sum_{y=0}^{2} p_{Y|X}(y|\, x) \tag{8}$$

$$= \frac{1}{3} \tag{9}$$

Similarly for $X = 1, 2$

$$p_Y(0) = p_Y(1) = p_Y(2) = \frac{1}{3} \tag{10}$$

$$H(Y) = -\sum_{y=0}^{2} p_Y(y) \log_2 p_Y(y) \tag{11}$$

$$= -\frac{1}{3} \log_2 \frac{1}{3} \times 3 \tag{12}$$

$$= \log_2 3 \tag{13}$$

$$H(Y|\, X) = -\sum_{x=0}^{2} \sum_{y=0}^{2} p_X(x)\, p_{Y|X}(y|\, x) \log_2 \left(p_{Y|X}(y|\, x)\right) \tag{14}$$

$$= -\sum_{x=0}^{2} p_X(x) \sum_{y=0}^{2} p_Y(y|\, x) \log_2 \left(p_Y(y|\, x)\right) \tag{15}$$

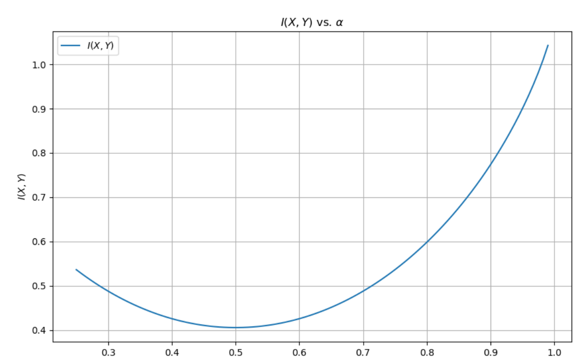
$$= -3 \times \frac{1}{3} \left(\alpha \log_2 \alpha + (1-\alpha) \log_2 (1-\alpha)\right) \tag{16}$$

Using (13) and (16) in (6)

$$I(X, Y) = \log_2 3 + \alpha \log_2 \alpha + (1-\alpha) \log_2 (1-\alpha) \tag{17}$$

$$\implies \frac{d}{d\alpha} I(X, Y) = \left(\log_2 \alpha - \log_2 (1-\alpha)\right) \tag{18}$$

For maxima or minima $\frac{d}{d\alpha} I(X, Y) = 0$



At $\alpha = \frac{1}{2}, I(X,Y)$ is minimum
$I(X,Y)$ is maximum at $\alpha = 1$
