Question: Let X be a random sample of size 1 from a population with cumulative distribution function

$$F(x) = \begin{cases} 0 & \text{if } x \leq 0 \\ 1 - (1-x)^{\theta} & \text{if } 0 \leq x < 1 \\ 1 & \text{if } x \geq 1, \end{cases} \tag{1}$$

where $\theta > 0$ is an unknown parameter. To test $H_0 : \theta = 1$ against $H_1 : \theta = 2$, consider using the critical region $(x \in \mathbb{R} : x < 0.5)$. If α and β denote the level and power of the test, respectively, then $\alpha + \beta$ (rounded off to two decimal places) equals

Solution: Given that,

$$H_0 : \theta = \theta_0 = 1 \tag{2}$$

$$H_1 : \theta = \theta_1 = 2 \tag{3}$$

So, the likelihood function is:

$$L = \prod_{i=1}^{1} F(x) \tag{4}$$

Level of test:

$$\alpha = p_X(x < 0.5 | \theta_0) \tag{5}$$

$$= F_X(0.5) \tag{6}$$

$$= 1 - (1 - 0.5) \tag{7}$$

$$= \frac{1}{2} \tag{8}$$

Power of test:

$$\beta = p_X(x < 0.5 | \theta_1) \tag{9}$$

$$= F_X(0.5) \tag{10}$$

$$= 1 - (1 - 0.5)^2 \tag{11}$$

$$= \frac{3}{4} \tag{12}$$

Now,

$$\alpha + \beta = \frac{1}{2} + \frac{3}{4} \tag{13}$$

$$= 1.25 \tag{14}$$
